PWSCode: Public Water System (PWS) Identification Code. The code used to identify each PWS. The code begins with the standard 2-character postal state abbreviation or Region code for Tribes; the remaining 7 numbers are unique to each PWS in the state.

Facilty water type: Source of water at the facility, SW (surface water), GW (ground water), GU (ground water under the direct influence of surface water), MX (Any combination of: SW, GW and GU)

Sampling Point Type: EP (entry point to the distribution system)

Sample Event: Identification code for each sample event (SE1, SE2, SE3 and SE4) - Represent samples collected to meet UCMR Assessment Monitoring requirements; where “SE1” and “SE2” represent the first and second sampling period for all water types; and “SE3” and “SE4” represent the third and fourth sampling period for SW, GU, and MX sources only.

Moni code: AM (Assessment Monitoring)

Method code: Identification code of the analytical method

Analyte code: EPA identification code of the analyte

Result measure: Reported values equal to or greater than the MRL.

MRL: Minimum Reporting Level, is the lowest concentration that laboratories are allowed to report to the EPA during monitoring under the UCMR. MRLs are based on laboratory analytical capability, not on potential health effects of the contaminant, and are determined through studies involving multiple laboratories to find a quantitation limit considered achievable nationwide.

Result below MRL: Y (result is below MRL) N (result is not below MRL)

Analyte status: PWS Approve/State Hold (applies to data that has been approved by the PWS. Data with this status is viewable by the State and EPA)
